

Meet the molecule toolbar

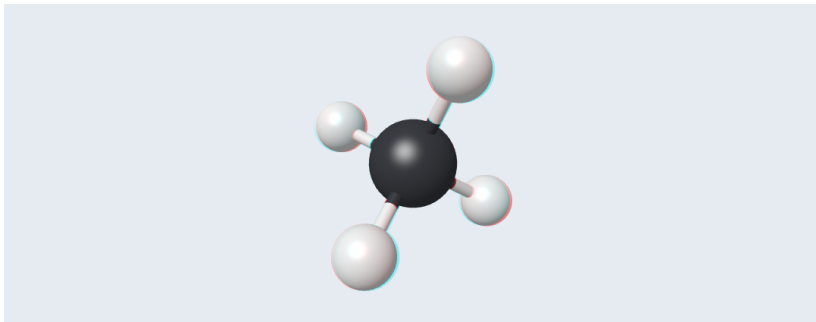

The controls unfold from the top-right corner of every molecule

Drag to rotate, scroll to zoom, and double-click to reset. Use the rotate button for a continuous spin around molecular Z. Collapse the toolbar with its teal close button and unfold it again with the sliders button.

Stereoscopic rendering

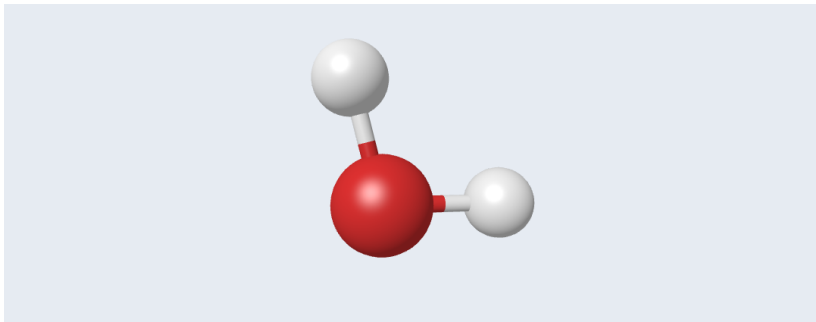

Toggle red/cyan anaglyph rendering with the glasses button

The two stereo cameras converge on the molecule center. Press the glasses button once to enable red/cyan and again to return to mono rendering.

Normal-mode vibrations

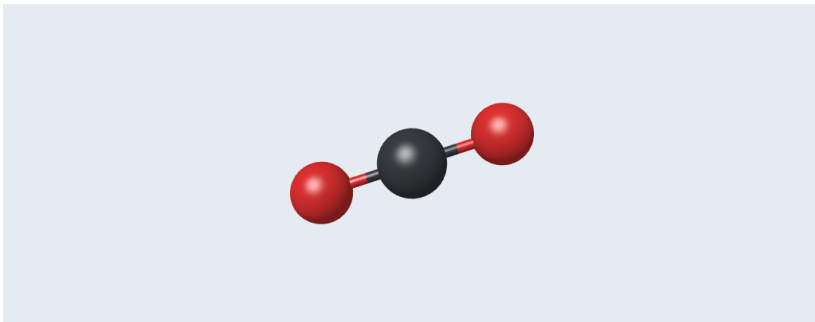

Use the play button to animate the water bending mode

Vibration-enabled XYZ records append d_x , d_y , and d_z to each atom. UIL applies the displacement sinusoidally while retaining interactive rotation.

Orientation axes

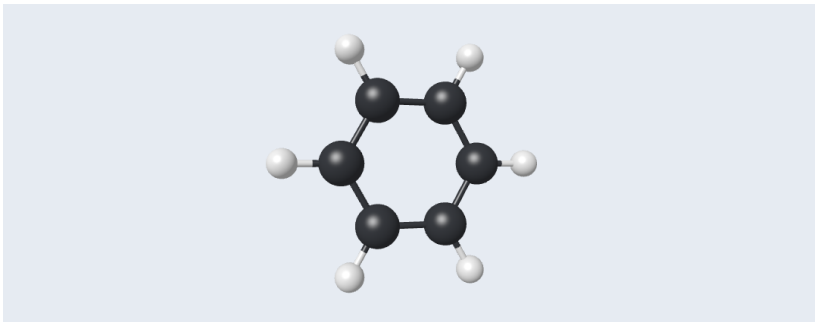

Toggle the Blender-style X/Y/Z gizmo with the compass button

Rotate the molecule and watch the corner gizmo follow it: X is red, Y is green, and Z is blue. This molecule also contains an asymmetric stretch.

Planar molecules

Benzene starts face-on in the YZ plane

The default camera looks along $-X$ with $+Z$ upward, so the aromatic ring is immediately visible.
Toggle continuous Z-axis rotation to inspect its planar geometry from different angles.
